                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention provides a pharmaceutical vaccine composition (1) for the prevention or treatment of a self-protein-mediated pathology. The composition comprises at least one modified immunogenic self-protein (selected from modified TNR-lpha proteins) and a surfactant capable of acting as a solubilizer. (I) is useful for preventing or treating a self-protein-mediated pathology such as an inflammatory disease, rheumatoid arthritis, an inflammatory bowel disease (ulcerative colitis or crohn's disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, disease), cancer, cachexia, multiple sclerosis, diabetes, psoriasis, self-protein such as TNF (tumour necrosis factor)-alpha in a human subject. (I) comprising cetylpyridinium chloride as a component is useful for immunisation of a human subject or for treatment of a human for immunisation of a human subject or treatment of a human inflammatory disease. The present sequence represents a human TNF-alpha

An osteoprotegerin ligand/tetanus toxoid P30 epitope fusion.

(first entry)

25-JUL-2000

```
The present sequence represents fusion protein of murine osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which is a secreted member of the tumour necrosis factor receptor family, which is blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is solveptides are 17% homologous. OPGL is a potent osteoclast the murine and human OPGL oplypeptides are 87% homologous. OPGL is a potent osteoclast the differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also a nativator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at least one OPGL polypeptide or subsequence, and/or at method and OPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption

The present sequence encodes a fusion protein of murine osteoprotegerin is a secreted member of the tumour necrosis factor receptor family, which blocks osteoclastogenesis in a dose dependent manner. The OPGL protein is synthesised as a type II transmembrane protein. The murine and human OPGL colypeptides are 81% homologous. OPGL is a potent osteoclast. differentiation factor when combined with CSF-1. It is not capable of inducing osteoclast differentiation in the absence of CSF-1. OPGL is also a activator of mature osteoclasts. The specification describes a method for the in vivo down-regulation of OPGL activity in an animal. The method comprises using at least one OPGL polypeptide or subsequence, and/or at method and OPGL polypeptide are useful for treating, preventing and method and oPGL polypeptide are useful for treating, preventing and ameliorating osteoporosis or other diseases or conditions characterised by excessive bone resorption
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

AAO30488
               The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNFalbha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with an inserted tecanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                     Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease;

ö
                                             The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (115) and tumour necrosis factor alpha (TNP, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with an inserted tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                 .;

This is an immunogenized MUC-1 analogue containing foreign epitopes P2 and P30. Immunogenic analogues of MUC-1 and, e.g. human prostate specific and P30. Immunogenic analogues of MUC-1 and, e.g. human prostate specific centembrane antigen (hPSM) can be used in the claimed method as an autovaccine to induce a CTL response. Subolominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms (see features table). 10 regions suitable for the insertion of foreign T helper epitopes were identified. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. hPSM, heregulin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the C cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and changed to predicted CTL and B-cell epitopes of the respective PA and including at correign to effect proper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human CPSM, FGF8b and Herz, respectively. Note: This sequence does not appear in the specification. It was made using the mucin repeat sequence CC (AAV92564), pp. and P30 (AAV92562-26), which appear on pages 220, 213 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouritsen S, Nielsen KG, Haaning J, Leach D, Dalum I;
                                                                                                                                                                                                                                                                                                                                              Mucin repeat; MUC-1 analogue; vaccination; self-protein; cancer; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.

The present sequence is that of AutoVac construct GDF-8 dimer comprising 2 copies of the 109-amino acid C-terminal region of human growth differentiation factor 8 (GDF-8, see AAF20141) convalently connected through the P2 and 80 T-cell epitopes (see AAB20143-44) of tetanus toxin. It is an object of the invention to produce a recombinant therapeutic vaccine that is capable of effecting down-regulation of GDF-8 in order to increase the muscle growth rate of farm animals. The vaccines (see AAB20145-53) are capable of breaking autotolerance against autologous GDF-8. They comprise the C-terminal portion of human GDF-8 in which a portion of the native sequence is replaced by a T-cell epitope such as P30, with minimal disturbance of the authentic 3-dimensional structure of the protein. Nucleic acids encoding the GDF-8 variants can be used for genetic immunisation of the animals. Down-regulation of GDF-8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Increasing the muscle mass of animals used in meat production by down regulating growth differentiation factor 8 (GDF-8) activity in the animal through induction of anti-GDF-8 antibody production.
                                                                                                                                                                                                                                                         Growth differentiation factor 8; GDF-8; myostatin; tetanus toxin; T-cell epitope; down-regulation; vaccine; muscle; meat; cachexia; cardiant; human; mutant; mutein.

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct which comprises 2 human interleukin 5 (IL5) monomers joined by tetanus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                  Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; interleukin 5; IL5; epitope; human; tetanus toxoid; chimeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.

The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct which comprises
                                                                                                                                                                                                                                                                                                                                                                      Multimeric protein; interleukin 5; IL5; TWFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; interleukin 5; IL5; epitope; human; tetanus toxoid; chimeric.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
activity can increase muscle mass by up to at least 45% in cattle, pigs and poultry used for meat production, reducing the need for antibiotic feed-additives. Anti-GDF® vaccines can be used to treat human diseases such as cancer cachexia where muscle atrophy is pronounced and for patients suffering from acute and chronic heart failure
                                                                                                                                          Gaps
                                                                                                                                          ;

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (115) and tumour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition
comprises 2 human interleukin 5 (IL5) monomers joined by diglycine linker and including terminally positioned tetanus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                     Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; interleukin 5; IL5; epitope; human; tetanus toxoid; chimeric; variant; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  preparing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNR, TNRalpha) and methods for production of immunogenic analogues. The immunogenic analogues is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct variant which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.

for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is a fusion construct variant which comprises 2 human interleukin 5 (ILS) monomers joined by diglygine linker and including terminally positioned tetranus toxoid epitopes P30 and P2. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle.
                                                                                                                                                                                                                                                                              Recombinant protein, CDC/NIIMALVAC-1; multivalent, malaria, vaccine, real-lepitope, treanue toxoid, antigent epitope; treatment, circumsporozoite protein, GSP, sporozoite surface protein-2; SSP-2; liver stage antigen-1; LSA-1; merozoite surface protein-1, MSP-1, MSP-2; applical membrane antigen-1, AMA-1; erythrocyte binding antigen-175; EBA-175; rhoptry associated protein-1, RAP-1; gamete specific antigen; Pfg27, antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;

ö
which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melittin signal peptide, (His)6 tag, T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CSP), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein-1 (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (RAP-1) and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of Plasmodium falciparum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for thetecting P. falciparum in biological samples. (Updated on 12-SEP-2003 to standardise OS field)

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (115) and tumnour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                 New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                          The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TNP, TNPalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNRalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetanus toxoid P2 and p30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.
                                                                                             New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (LL5) and tumour necrosis factor alpha (TNF, TNFalpha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TNFalpha variant protein with 3 hTNF sequences joined by glycine linkers and tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CEA; immune response; carcinoembryonic antigen; antigen presenting cell; APC; cytostatic; vaccine; human; tetanus toxoid; p2; p30; antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New immunogenic analogue of a polymeric protein, useful for preparing a composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to immunogenic analogues of multimeric proteins such as immunogenic variants of interleukin 5 (IL5) and tumour necrosis factor alpha (TWF, TWRPIDha) and methods for production of immunogenic analogues. The immunogenic analogue is useful for preparing a composition for treating inflammatory diseases, e.g., arthritis. It is also used in gene therapy. The present sequence is human TMRalpha variant protein. The variant comprises 3 hTMF sequences joined by glycine linkers and tetanus toxoid P2 and P30 epitopes. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Multimeric protein; interleukin 5; IL5; TNFalpha; inflammatory disease; tumour necrosis factor alpha; gene therapy; arthritis; human; mutant; variant; tetanus toxoid; epitope; mutein.
                                                                                                                                                                                                                                                                                                                                      New immunogenic analogue of a polymeric protein, useful for preparing composition for treating inflammatory diseases e.g. arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..

                                                                                                                                                                                                                                                                                                                                                                                                        g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least 1 modified CEA polypeptide or of a mucleic acid encoding the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a truncated human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                                                                                                                                                                                Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Portion of B fragment and all of the C fragment of tetanus toxin.

cc antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-profeins), e.g. than prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8b (PGP8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA, and (2) at least 1 Erset T helper call group which is foreign to the animal. Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective A and including at least one foreign T helper epitopes are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectivelly. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187; of the specification

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenized analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are continuogenized forms. The method is used for inducing immune responses against weakly immunogenize cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. antigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 8D (FGF8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCB) of the animal simmune system of: (1) at least 1 CTL (cytocoxic T-1ymphocyte) crossing to the animal. Analogues of human PSM, human Her2 and chind animal, murine FGF8D comprising a substantial part of all known and chast one foreign T helper splitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human CCC least one foreign T helper splitope are also claimed. The method is used to the wild type human PSM, (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                  Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CBA; immune response; carcinoembryonic antigen; antigen presenting cell; APC; cytostatic; vaccine; human; tetanus toxoid; p2; p30; antigen.

```
The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCs) in the animal of at least 1 modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response or virus expressing the modified CEA polypeptide to induce a CTL response or virus expressing the modified CEA polypeptide to induce a CTL response or virus expressing the suggest the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                  Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a ,

                                                                           The invention relates to inducing an immune response against autologous carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCS) in the animal of at least 1 modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is useful in immunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inducing an immune response in humans against autologous carcinoembryonic antigen (CEA) comprises administering a modified CEA polypeptide, a nucleic acid encoding the polypeptide, or a microorganism expressing the
nucleic acid encoding the polypeptide, or a microorganism expressing the

carcinoembryonic antigen (CEA) in an animal, e.g. human. The method involves effecting uptake and processing by antigen presenting cells (APCB) in the animal of at least I modified CEA polypeptide or of a nucrocranic animal of at least I modified CEA polypeptide or of a microorganism or virus expressing the modified CEA polypeptide to induce a CTL response and an antibody response that targets the autologous CEA. The method is the target in inmunizing actively against diseases characterized by cells that express CEA. The present sequence represents a modified human CEA polypeptide that has tetanus toxoid (TT) P2 and P30 epitopes introduced

imune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PBM), hereagulin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) croup derived from the PA and/or at least 1 D-cell group derived from the Cell-associated PA, and (2) at least 1 Erst T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human psM, FGBb and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                  AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenic remembers. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide artigens (PAM) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8D (PGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animal simune system of: (1) at least 1 CTL (Cytotoxic T-1ymphocyte) Groeign to the animal Analogues of human PSM, human HErz and channan/murine FGP8D comprising a subsetantial part of all known and channan/murine FGP8D comprising a subsetantial part of all known and channan/murine FGP8D comprising a subsetantial part of all known and channan/murine FGP8D comprising a subsetantial part of all known and channan/murine fGP8D comprising a subsetantial part of all known and channan/murine fGP8D comprising a subsetantial part of all known and channan/murine fGP8D comprising a subsetantial part of all known and channan/murine fGP8D and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the apper file and the pages 184-187 of the appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Steinaa L, Mouritsen S, Nielsen KG, Haaning J, Leach D, Dalum I;

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenized antigenes of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are compressed in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenize cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (HBr2) and/or fibroblast growth factor 8D (FGF8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the simular system of: (1) at least 1 CTL (Cyttoxof, T-1)ymphocyte) crosinismis immune system of: (1) at least 1 B-cell group derived from the CC group derived from the PA and/or at least 1 B-cell group derived from the CC cell-associated PA, and (2) at least 1 B-cell group derived from the CC group derived from the PA and (2) at least 1 first T helper cell group which is comparising a substantial part of all known and contained crossing T helper epitopes of the respective PA and including at predicted CTL and B-cell epitopes of the respective PA and including at class prostate, prostate/breast or breast cancer when the PA is human PSM, FGP8D and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                   Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are controlled by the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. when the immunogenized forms. The method comprises effecting cimultaneous presentation by antigen producing cells (APCS) of the simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) controlled from the PA and (Or at least 1 B-cell group darived from the PA and (Or at least 1 B-cell group darived from the Ccll-associated PA, and (2) at least 1 Broat of all known and controlled from the animal. Analogues of human PSM, human Her2 and collected CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitopes of the respective PA and including at collectic protectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 collectication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                             Nielsen KG, Haaning J,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The immunogenic analogues of PSM can be used in the claimed method as an autoractor of induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immunogenized forms. The method is used for inducing are preserved in the immunogenized forms. The method is used for inducing antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or chuman prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or cilbroblast growth factor 8b (PGF8b). The method comprises effecting simultaneous presentation by artigen producing cells (APCB) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 first T helper cell group which is cell-associated PA; and (2) at least 1 first T helper cell group which is cell-associated PA; and (2) at least 1 of all known and chuman/murine PGF8b comprising a substantial part of all known and chuman/murine PGF8b comprising a subscrittle prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the anexification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

```
AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogeniz cell-associated peptide artigens (PA) such as those associated with cancers (self-proteins), e.g. thusan prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8D (FGPB). The method comprises effecting simultaneous presentation by antigen producing cells (APCB) of the simultaneous presentation by antigen producing cells (APCB) of the call ansociated PA, and (2) at least 1 B-cell group derived from the CC group derived from the PA and/or at least 1 B-cell group derived from the CC cell-associated PA, and (2) at least 1 first T helper cell group which is coreign to the animal. Analogues of the respective PA and including at the predicted CTL and B-cell epitopes of the respective PA and including at coreign one foreign The helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGFBD and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the anergister.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antigen (PSM) constructs, which contain foreign epitopes (PZ and/or PRO). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor BA (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the foreign to the animal. Analogues of human PSM, human Her2 and an animal. Analogues of human PSM, human Her2 and an animals foreign to the animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human/murine FGFBb comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGFBb and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAV92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dalum I;

Nielsen KG, Haaning J,

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immuno responses against weakly immunogenic cell-associated peptide attigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGR8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and (Or at least 1B -cell group derived from the Ccll are from the PA and (Or at least 1B -cell group derived from the Ccll are specific at least 1B -cell group derived from the animal. Analogues of human PSM, human Her2 and predicted CTL and B-cell epitopes of the respective PA and including at cleast one foreign T helper epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used from the wild type human PSM (AAY92619), which appears on pages 184-187 cof the specification Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer. Example 1; Page; 220pp; English WPI; 2000-349917/30.

Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer. Example 1; Page; 220pp; English.

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are controlled to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are controlled to inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. thunan prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGR8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) crowing from the PA and (Or at least 1 B-cell group darived from the pa and (Or at least 1 B-cell group which is foreign to the animal. Analogues of human PSM, human Her2 and created foreign T helper epitopes of the respective PA and including at least one foreign T helper epitopes of the respective PA and including at control foreign T helper epitopes of the respective PA and including the DSM, FGP8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 coff the specification

Sequence 750 AA;

                                                                                                                                    8
                                                                                                                                                                                                                      AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (ESM) constructs, which contain foreign epitopes (P2 and/or P30).

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic call-associated peptide intigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor BN (FGPBA). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least I CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least I B-cell group derived from the coll and (2) at least I first helper cell group which is

The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. muman prostate specific membrane antigen (PSM), heregullin 2 (Herz) and/or fibroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antigen producing cells (APCs) of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGFBb and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Dalum I;

animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) cerl-associated by and/or at least 1 B-cell group derived from the cell-associated by, and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and human/murine FGF8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Herz, respectively. Note: This sequence was constructed in the man pSM (AAV92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Dalum I;

preserved in the immunogenized former. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide antiquent responses against weakly immunogenic cell-associated peptide antiquent state of the specific membrane antiquent cancers (self-proteins), e.g. human prostate specific membrane antiquen (PSM), heregulin 2 (Herz) and/or ithroblast growth factor 8b (FGF8b). The method comprises effecting simultaneous presentation by antiquent cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the CC cell-associated PA, and (2) at least 1 iffset T helper cell group which is foreign to the animal. Analogues of human PSM, human Herz and predicted CTL and B-cell epitopes of the respective A and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FSM, FGBb and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic caliamed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are confirmant epitopes (PCC binding regions and cysteine residues involved in disulfide bonds are confirmant responses against weakly immunogenic cell-associated peptide antigens (PA) such as those associated with cancers (self-proteins), e.g. numan prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the C cell-associated PA, and (2) at least 1 B-cell group which is foreign to the animal. Analogues of human PSM, human Her2 and c predicted CTL and B-cell epitopes of the respective PA and including at protected from the proper epitope are also claimed. The method is used C to treat prostate, prostate/breast or breast cancer when the PA is human C PSM, FGFBb and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prostate specific membrane antigen; immunogenized construct; mutant; vaccination; cytotoxic T-lymphocyte immunity; breast cancer; prostate cancer; cell-associated peptide antigen; foreign epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mutant human prostate specific membrane antigen construct, hPSM1.3.

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize and grow as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are controlled to the immunogenized forms. The method is used for inducing immune responses against weakly immunogenize cell-associated peptide autigens (PA) such as those associated with cancers (self-proteins), e.g. autigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Harz) and/or fibroblast growth factor 8D (FGF8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the simular system of: (1) at least 1 GTL (Cytocoxic T-lymphocyte) crowing into the anial. Analogues of human PSM, human Herz and chick comprising a substantial part of all known and channal. Analogues of the respective PA and including at concert prostate. Analogues of the respective PA and including at concert prostate, prostate Abreas to a last one foreign T helper epitopes of the respective PA and including at concert prostate, prostate Abreas to arbanial subsed cube will knype human PSM, rGF8D and Herz, respectively. Note: This sequence was constructed for the wild type human PSM (AAY92619), which appears on pages 184-187 of the abreas and the pages 184-187.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                           Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HX S S X X X X X X D X L X Y X Y 1
                                                                                                                                                                                AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic actaimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immunogenized forms. The method is used for inducing immunogenized sasociated with cancers (self-proteins), e.g. antigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGR8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) coll-associated PA, and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and presented for mine a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at least one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, RGPBb and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 coll the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó
                                                                                                                    Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenize analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are controlled in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenic cell-associated peptide autigens (PA) such as those associated with cancers (self-proteins), e.g. autigens (PA) such as those associated with cancers (self-proteins), e.g. thuman prostate specific membrane antigen (PSM), heregulin 2 (Herz) and/or fibroblast growth factor 8D (FGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APCS) of the simular system of: (1) at least 1 Ectl group derived from the PA and/or at least 1 B-cell group derived from the PA and/or at least 1 B-cell group which is coll-associated PA, and (2) at least 1 Eirst T helper cell group which is coreign to the animal. Analogues of human PSM, human Herz and chuman/murine FGF8D comprising a substantial part of all known and chuman/murine FGF8D comprising a substantial part of all known and chuman/murine prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8D and Herz, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.
                                                                                                                                                                                                                                                                                          Dalum I;

AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenic analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immuno responses against weakly immunogenic cell-associated peptide attigens (PA) such as those associated with cancers (self-proteins), e.g. human prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGR8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the animals immune system of: (1) at least 1 E-cell group derived from the PA and (Or at least 1 B-cell group derived from the PA and (2) at least 1 B-cell group derived from the Ccell-associated PA; and (2) at least 1 B-cell group derived from the Creign to the animal. Analogues of human PSM, human Her2 and producing at least one foreign T helper epitopes of the respective PA and including at least one foreign T helper epitopes are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, RGFBb and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                    Inducing immune responses to weakly immunogenic, tumor associated peptide antigens for the treatment of breast and prostate cancer.

```
AAY92627-49 are mutant immunogenized human prostate specific membrane antigen (PSM) constructs, which contain foreign epitopes (P2 and/or P30). The immunogenized analogues of PSM can be used in the claimed method as an autovaccine to induce a CTL response. Subdominant CTL epitopes, antibody binding regions and cysteine residues involved in disulfide bonds are preserved in the immunogenized forms. The method is used for inducing immune responses against weakly immunogenized paperial proteins, e.g. artigens (PA) such as those associated with cancers (self-proteins), e.g. thuran prostate specific membrane antigen (PSM), heregulin 2 (Her2) and/or fibroblast growth factor 80 (FGP8D). The method comprises effecting simultaneous presentation by antigen producing cells (APC8) of the onimals immune system of: (1) at least 1 CTL (cytotoxic T-lymphocyte) group derived from the PA and/or at least 1 B-cell group derived from the cell-associated PA; and (2) at least 1 first T helper cell group which is foreign to the animal. Analogues of human PSM, human Her2 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human/murine FGP8b comprising a substantial part of all known and predicted CTL and B-cell epitopes of the respective PA and including at beast one foreign T helper epitope are also claimed. The method is used to treat prostate, prostate/breast or breast cancer when the PA is human PSM, FGF8b and Her2, respectively. Note: This sequence was constructed from the wild type human PSM (AAY92619), which appears on pages 184-187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes a single chain polypeptide comprising clostridial neurotoxin light and heavy chains. The single chain clostridial neurotoxin light chain, or its fragment or variant, which is capable of neurotoxin light chain, or its fragment or variant, which is capable of cleaving one or more vesicle or plasma membrane associated proteins or essential to exceptosis; the second domain is a clostridial neurotoxin heavy chain H-N portion, or its fragment or variant, which is capable of translocating the polypeptide compared to the solubility of the polypeptide compared to the solubility of the first command part of command on its own. The second domain lacks a functional C-terminal part of a clostridial neurotoxin heavy chain, designated H-C, which renders the natural cell surface receptors to which native clostridial neurotoxin binds. Also described is a nucleic acid molecule encoding the single chain polypeptide described above. The single chain polypeptide as positive controls for toxin assays, as antibacterial activity, and can be used any oblypeptides can be used as positive controls for toxin assays, as contibacterial as non-toxic standards for the assessment and development of in vitro assays for detection of functional botulinum or tetanus neurotoxins the answerial impacts. The present sequence is used in the answerial as and in a second sequence is used in an encoder in the answerial samples. The present sequence is used in a necessary than the present sequence is used in a necessary than answerial and the example of the present sequence is used in the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example of the example o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New single chain polypeptides comprising clostridial neurotoxin light and heavy chains, useful as positive controls for toxin assays, or for developing vaccines against clostridial toxin.
                                                                                                                  exocytosis;

                                                                                                                                                                                                                                                                                                  Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin having one peptide epitope of the antigen attached to the immunoglobulin.
                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to a method for generating an immune response to an antigen in a patient. The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. The present sequence is an antigen sequence, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                single chain polypeptide; clostridial neurotoxin light chain; clostridial neurotoxin heavy chain; Clostridium; neurotoxin; exocytosis; antibacterial; vaccine; toxin assay; clostridial toxin; detection;

The present invention describes a single chain polypeptide comprising clostridial neurotoxin light and heavy chains. The single chain polypeptide comprises 2 domains: the first domain is a clostridial neurotoxin light chain, or its fragment or variant, which is capable of cleaving one or more vesicle or plasma membrane associated proteins essential to exceptosis; the second domain is a clostridial neurotoxin heavy chain H-N portion, or its fragment or variant, which is capable of translocating the polypeptide compared to the solubility of the polypeptide compared to the solubility of the first domain on its own. The second domain lacks a functional C-terminal part of a clostridial neurotoxin heavy chain, designated H-C, which renders the natural cell surface receptors that are the natural cell surface receptors to which native clostridial neurotoxin heavy chain, designated H-C, which renders the natural cell surface receptors to which native clostridial neurotoxin has a nucleic acid molecule encoding the single chain bolypeptide described above. The single chain polypeptide described above. The single chain polypeptides can be used as positive controls for toxin assays, as creagent components for the synthesis of therapeutic molecules are also useful as non-toxic standards for the assessment and development of in
                                                                                                                                                                        New single chain polypeptides comprising clostridial neurotoxin light and heavy chains, useful as positive controls for toxin assays, or for developing vaccines against clostridial toxin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       vitro assays for detection of functional botulinum or tetanus neurotoxins in foodstuffs or environmental samples. The present sequence is used in the exemplification of the present invention.

The present invention describes a single chain polypeptide comprising clostridial neurotoxin light and heavy chains. The single chain clostridial neurotoxin light and heavy chains. The single chain colorpapetide comprises 2 domains: the first domain is a clostridial neurotoxin light chain, or its fragment or variant, which is capable of cleaving one or more vesicle or plasma membrane associated proteins essential to exocytosis; the second domain is a clostridial neurotoxin heavy chain H-N portion, or its fragment or variant, which is capable of translocating the polypeptide into a cell and/or increasing the companies of the polypeptide into a cell and/or increasing the solubility of the polypeptide compared to the solubility of the first of a clostridial neurotoxin heavy chain, designated H-C, which renders the natural cell surface receptors to which native clostridial neurotoxin binds. Also described as another according the single chain polypeptide described above. The single chain polypeptide described above. The single chain polypeptide described above. The single chain polypeptide son be used as positive controls for toxin assays, as antibacterial activity, and can be used in vaccines. The single chain collypeptides are also cases and be used as positive controls for twan assays, creagent components for the synthesis of therapeutic molecules, or for developing vaccines against clostridial toxin. The polypeptides are also viero assays for detection of functional botulinum or tetanus neurotoxins in foodstuffs or environmental samples. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                        New single chain polypeptides comprising clostridial neurotoxin light and heavy chains, useful as positive controls for toxin assays, or for developing vaccines against clostridial toxin.

```

The present sequence is given in a specification relating to a novel polypeptide comprising tetanus toxin (TeNT) fragment C or its immunogenic fragment, containing a mutation in a loop region. The mutation results in a reduction in the binding of TeNT fragment C or its immunogenic fragment to ganglicaides and primary motoneurones, and/or a reduction in the ability of TeNT fragment C or its immunogenic fragment to undergo retrograde transport. The polypeptide is useful for treating, preventing and reducing the susceptibility to Clostridium tetani infection in a human or animal, and also for producing antibodies which recognise groups within TeNT polypeptides. Antibody produced against the polypeptide is also useful for treating Clostridium tetani infection

¢

The present invention describes a single chain polypeptide comprising clostridial neurotoxin light and heavy chains. The single chain polypeptide comprises 2 domains: the first domain is a clostridial neurotoxin light chain, or its fragment or variant, which is capable of cleaving one or more vesicle or plasma membrane associated proteins cessential to excoytosis; the second domain is a clostridial neurotoxin heavy chain H-N portion, or its fragment or variant, which is capable of translocating the polypeptide compared to the solubility of the polypeptide compared to the solubility of the polypeptide compared to the solubility of the first. Comain on its own. The second domain lacks a functional C-terminal part of a clostridial neurotoxin heavy chain, designated H-C, which renders the polypeptide incapable of binding to cell surface receptors that are the natural cell surface receptors to which native clostridial neurotoxin heavy chain, designated H-C, which renders the natural cell surface receptors to which native clostridial neurotoxin components for the single chain polypeptide described above. The single chain polypeptide described above. The single chain polypeptides can be used as positive controls for toxin assays, as reagent components for the synthesis of therapeutic molecules, or for developing vaccines against clostridial toxin. The polypeptides are also vitro assays for detection of functional botulinum or tetanus neurotoxins in fordstuffs or environmental samples. The present sequence is used in the exemplification of the present invention.

                                   NiAlternate names: BONT/CI protein
Cispecies: Clostridium botulinum phage IC
Species: Clostridium botulinum phage IC
Aivariev: strain C 468
Cibacession: 846431; 849107
Rithauser, D.; Eklund, M.W.; Boquet, P.; Popoff, M.R.
Rithauser, D.; Eklund, M.W.; Boquet, P.; Popoff, M.R.
Airlie: Organization of the botulinum neurotoxin CI gene and its associated non-toxic A; Reference number: 846426; MuID:94301293; PMID:8028579
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A,Cross-references: UNIPROT: O62165; GB:chr_I; PIDN: CAB04109.1; PID: 93875883; GSPDB: GN00d

Nat. Struct. Biol. 4:788-792(1997).

-I. FUNCTION: Tetamus toxin acts by inhibiting neurotransmitter
release. It binds to peripheral neuronal synapses, is internalized
and moves by retrograde transport up the axon into the spinal cord
where it can move between postsynaptic and presynaptic neurons. It
inhibits neurotransmitter release by acting as a zinc
endopeptidase that catalyzes the hydrolysis of the 76-Gln-|-Phe-77
bond of synaptobrevin-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               IDENTIFICATION OF SUBSTRATE.
